

# CHAPTER 6: RECOMMENDATION SYSTEMS

**Subject: Introduction to data science**

**Instructor: Đinh Xuân Trường**

**Posts and Telecommunications Institute of Technology**

**Hanoi, 2024**

## What is recommender systems?

- **A recommender system (RS)** helps users that have no sufficient competence or time to evaluate the, potentially overwhelming, number of alternatives offered by a web site.
  - ▶ In their simplest form, RSs recommend to their users personalized and **ranked lists of items**

(a) Book recommender system.

(b) Google search.

## What is recommender systems?

- Systems for recommending items (e.g. books, movies, CD's, web pages, newsgroup messages) to users based on examples of their preferences.
- Many websites provide recommendations (e.g. Amazon, NetFlix, Pandora).
- Recommenders have been shown to substantially increase sales at on-line stores.
- There are two basic approaches to recommending:
  - ▶ Collaborative Filtering (a.k.a. social filtering)
  - ▶ Content-based

## Content

- 1 Collaborative filtering
  - Concepts
  - Uses for CF
  - Algorithms
  - Practical issues
  - Evaluation metrics
- 2 Content-based recommender (CBR)
- 3 Hybrid approach

## Concepts

- Collaborative Filtering.
  - ▶ The process of information filtering by collecting human judgments (ratings)
  - ▶ “word of mouth”
- User: Any individual who provides ratings to a system
- Items: Anything for which a human can provide a rating

## Concepts

	Star Wars	Hoop Dreams	Contact	Titanic
Joe	5	2	5	4
John	2	5		3
Al	2	2	4	2
Nathan	5	1	5	?

The problem of collaborative filtering is to predict how well a user will like an item that he has not rated given a set of historical preference judgments for a community of users.

## Uses for CF: User tasks

What tasks users may wish to accomplish

- ▣ Help me find new items I might like
- ▣ Advise me on a particular item
- ▣ Help me find a user (or some users) I might like
- ▣ Domain-specific tasks
- ▣ Help me find an item, new or not

## Uses for CF: System tasks

What CF systems support

- Recommend items
  - ▶ Eg. Amazon.com
- Predict for a given item
- Constrained recommendations
  - ▶ Recommend from a set of items

## Uses for CF: Amazon.com

The screenshot shows the Amazon.com website in a Microsoft Internet Explorer browser window. The page is titled "Recommended for Sue Yeon Syn (If you're not Sue Yeon Syn, [click here](#))". It features a search bar at the top and a navigation menu on the left. The main content area displays a list of recommended products, each with a cover image, title, author, customer review, publication date, price, and "Add to cart" and "Add to Wish List" buttons. The recommendations are based on items the user has viewed or added to their shopping cart.

**Recommended for Sue Yeon Syn** (If you're not Sue Yeon Syn, [click here](#))

**Narrow by Event**  
[Your Watch List](#) (Beta)

**Narrow by Category**  
[Apparel & Accessories](#)  
[Baby](#)  
[Beauty](#)  
[Books](#)  
[Camera & Photo](#)  
[Computer & Video](#)  
[Games](#)  
[Computers](#)  
[DVD](#)  
[Electronics](#)  
[Health & Personal Care](#)  
[Jewelry & Watches](#)  
[Kitchen & Housewares](#)  
[Magazine Subscriptions](#)

- When Things Start to Think**  
by Gershenfeld Neil  
Average Customer Review: [★★★★☆](#)  
Publication Date: February 15, 2000  
Our Price: **\$11.20** [Used & new](#) from \$2.00  
Rate this item ☒ ☐ I own it ☐ Not interested  
Recommended because you added [The Unfinished Revolution](#) to your Shopping Cart ([edit](#))
- Weaving the Web: The Original Design and Ultimate Destiny of the World Wide Web**  
by Tim Berners-Lee  
Average Customer Review: [★★★★☆](#)  
Publication Date: November 1, 2000  
Our Price: **\$10.20** [Used & new](#) from \$2.71  
Rate this item ☒ ☐ I own it ☐ Not interested  
Recommended because you added [The Unfinished Revolution](#) to your Shopping Cart ([edit](#))
- Perl Cookbook, Second Edition**  
by Tom Christiansen, Nathan Torkington  
Average Customer Review: [★★★★☆](#)  
Publication Date: August 21, 2003  
Our Price: **\$32.97** [Used & new](#) from \$15.64  
Rate this item ☒ ☐ I own it ☐ Not interested  
Recommended because you added [Programming Perl \(2nd Edition\)](#) to your Wish List and more ([edit](#))
- Network Analysis, Architecture and Design, Second Edition (The Morgan Kaufmann Series in Networking)**  
by James O. McCabe  
Average Customer Review: [★★★★☆](#)  
Publication Date: April 1, 2003  
Our Price: **\$58.46** [Used & new](#) from \$45.77  
Rate this item ☒ ☐ I own it ☐ Not interested  
Recommended because you added [Programming Perl \(2nd Edition\)](#) to your Wish List and more ([edit](#))

[Not Interested](#)

## Uses for CF: Domains

- ▣ Many items
- ▣ Many ratings
- ▣ Many more users than items recommended
- ▣ Users rate multiple items
- ▣ For each user of the community, there are other users with common needs or tastes
- ▣ Item evaluation requires personal taste
- ▣ Items persists
- ▣ Taste persists
- ▣ Items are homogenous

## Algorithms

## Algorithms: Non-probabilistic

### □ User-based Nearest Neighbor

- ▶ Neighbor = similar users
- ▶ Generate a prediction for an item  $i$  by analyzing ratings for  $i$  from users in  $u$ 's neighborhood

$$pred(u, i) = \bar{r}_u + \frac{\sum_{n \in neighbor(n)} sim(u, n) \cdot (r_{ni} - \bar{r}_n)}{\sum_{n \in neighbor(n)} sim(u, n)} \quad (1)$$

## Algorithms: Non-probabilistic

### □ Item-based Nearest Neighbor

- ▶ Generate predictions based on similarities between items.
- ▶ Prediction for a user  $u$  and item  $i$  is composed of a weighted sum of the user  $u$ 's ratings for items most similar to  $i$ .

$$pred(u, i) = \frac{\sum_{j \in ratedItems(u)} sim(i, j) \cdot (r_{uj})}{\sum_{j \in ratedItems(u)} sim(i, j)} \quad (2)$$

## Algorithms: Non-probabilistic

### □ Dimensionality Reduction

- ▶ Reduce domain complexity by mapping the item space to a smaller number of underlying dimensions.
- ▶ Dimension may be latent topics or tastes.
- ▶ Vector-based techniques
  - Vector decomposition
  - Principal component analysis
  - Factor analysis

## Algorithms: Probabilistic

- ▣ Represent probability distributions
- ▣ Given a user  $u$  and a rated item  $i$ , the user assigned the item a rating of  $r : p(r|u, i)$ .

$$E(r|u, i) = \sum_r r \cdot p(r|u, i) \quad (3)$$

- ▣ Bayesian-network models, Expectation maximization (EM) algorithm

## Practical issues: Rating

### □ Explicit vs. Implicit ratings

#### ▶ Explicit ratings

- Users rate themselves for an item
- Most accurate descriptions of a user's preference
- Challenging in collecting data

#### ▶ Implicit ratings

- Observations of user behavior
- Can be collected with little or no cost to user
- Ratings inference may be imprecise.

## Practical issues: Rating

- Scalar ratings
  - ▶ Numerical scales.
  - ▶ 1-5, 1-7, etc.
- Binary ratings
  - ▶ Agree/Disagree, Good/Bad, etc.
- Unary ratings
  - ▶ Good, Purchase, etc.
  - ▶ Absense of rating indicates no information.

## Practical issues: Cold start

- New user
  - ▶ Rate some initial items
  - ▶ Non-personalized recommendations
  - ▶ Describe tastes
  - ▶ Demographic info.
- New item
  - ▶ Non-CF : content analysis, metadata
  - ▶ Randomly selecting items
- New community
  - ▶ Provide rating incentives to subset of community
  - ▶ Initially generate non-CF recommendation
  - ▶ Start with other set of ratings from another source outside community

## Evaluation metrics

### □ Accuracy

#### ▶ Predict accuracy

- The ability of a CF system to predict a user's rating for an item
- Mean absolute error (MAE)

#### ▶ Rank accuracy

- Precision – percentage of items in a recommendation list that the user would rate as useful
- Half-life utility – percentage of the maximum utility achieved by the ranked list in question

## Evaluation metrics

- Novelty
  - ▶ The ability of a CF system to recommend items that the user was not already aware of.
- Serendipity
  - ▶ Users are given recommendations for items that they would not have seen given their existing channels of discovery.
- Coverage
  - ▶ The percentage of the items known to the CF system for which the CF system can generate predictions.

## Evaluation metrics

- Learning rate
  - ▶ How quickly the CF system becomes an effective predictor of taste as data begins to arrive.
- Confidence
  - ▶ Ability to evaluate the likely quality of its predictions.
- User satisfaction
  - ▶ By surveying the users or measuring retention and use statistics

## Concepts

- CBR systems recommends an item to user.
- Maintains a profile of user's interests.
- Being used in variety of domains (web-pages, new articles, restaurants, TV programs)
- Main utility of CBR systems is in
  - ▶ Selecting a subset of items to be displayed
  - ▶ Determining an order to display the items

## Concepts: Item representation

- Items are stored in db table.
- Each item has a unique identifier key.
- Data can be structured or unstructured.
  - ▶ Structured – a list of restaurants.
  - ▶ Unstructured – news articles
  - ▶ Unstructured data is more complex
  - ▶ Data can also be semi-structured
  - ▶ Unrestricted text can be converted to structured representation.

## User profiles

- Most recommendation systems use profile of user's interests.
- Generally there are two types of information.
  - ▶ A model of user's preferences i.e., a description of the types of items that interest the user.
  - ▶ A history of the user's interactions with the recommendation system, it can also include queries typed by the user.
    - History in CBR also serves as training data for a machine learning algorithm that creates a user model.

## User profiles

- User model can also be made by user customization.
  - ▶ System provides an interface to construct a representation of user's interests.
  - ▶ Often check boxes and forms are used.
  - ▶ There are many limitations of user customization, it can't capture changing preferences.
    - They do not provide a way to order the items.
    - They do not provide detailed personalized recommendation.

## User profiles

### □ Learning a user model

- ▶ Creating a model of the user's preference from the user history.
- ▶ The training data is divided into categories.
  - The binary categories 'items the user likes'.
  - 'Items the user doesn't like'.
- ▶ This is accomplished either by explicit feedback or by observing the users interactions with items.
- ▶ Importance of classification algorithms is in providing an estimate of the probability that a user will like an unseen item.

## Algorithm

There are several algorithm that can be used to train user model:

- Decision trees and rule induction
- Nearest Neighbor methods
- Relevance feedback and Rocchio's algorithm
- Linear classifiers
- Probabilistic methods and Naive Bayes

## Algorithm

### ▣ Decision tree and rule induction

- ▶ Ex. are ID3 (Quinlan, 1986) , RIPPER (Cohen, 1995)
- ▶ Decision tree learners like ID3, build tree by recursively partitioning training data.
- ▶ They are excellent with structured data.
- ▶ They are not ideal for unstructured text classification tasks (Pazzani and Billsus, 1997)
- ▶ Rule induction algorithm (RIPPER) are closely related to decision trees.
- ▶ RIPPER performs competitively with other state-of-the-art text classification algorithm.
- ▶ Ripper supports multi-valued attributes.
- ▶ This makes it a good for text classification tasks.

## Algorithm

### □ Nearest neighbor methods

- ▶ Nearest neighbor algorithm stores all of its training data, in memory.
- ▶ A new unlabeled item is compared to all stored items using a similarity function and determines the 'nearest neighbor' or the k nearest neighbors.
- ▶ Numeric score or class label is derived for the unseen item.
- ▶ Similarity function depends on the type of data.
- ▶ For structured data, a Euclidean distance metric is used.
- ▶ For vector space model, the cosine similarity is used.

## Algorithm

### □ Relevance feedback and Rocchio's algorithm

$$Q_{i+1} = \alpha Q_i + \beta \sum_{rel} \frac{D_i}{|D_i|} - \gamma \sum_{monrel} \frac{D_i}{|D_i|} \quad (4)$$

- ▶ Principle is to allow users to rate documents returned by the retrieval system.
- ▶ There are explicit and implicit means of collecting relevance feedback data.
- ▶ Rocchio's algorithm is widely used algorithm that operates in the vector space model.
- ▶ Based on the modification of initial query through differently weighted prototypes of relevant and non-relevant documents.

## Algorithm

### □ Linear classifiers

- ▶ These algorithms learn linear decision boundaries.
- ▶ Hyper planes separating instances in a multi-dimensional space.
- ▶ Suitable for text classification tasks (Lewis et.al. 1996)
- ▶ Outcome of learning process is an n-dimensional weight vector.
- ▶ Threshold is used to convert continuous predictions to discrete class labels.

## Algorithm

### □ Probabilistic methods and Naïve Bayes

- ▶ Naïve Bayes is an exceptionally well performing text classification algorithm.
- ▶ Two frequently used formulations of naïve Bayes
  - Multi-variate Bernoulli
  - Multinomial model
  - Both model assumes that text doc. Are generated by a parameterized mixture model

$$P(d_i|\theta) = \sum_{j=1}^{|C|} P(c_j|\theta)P(d_i|c_j; \theta) \quad (5)$$

## Algorithm

### □ Probabilistic methods and Naïve Bayes

- ▶ Multivariate Bernoulli formulation was derived with structured data in mind.
- ▶ Multinomial formulation captures word frequency information.
- ▶ Multinomial naïve Bayes formulation outperforms multivariate Bernoulli model.
  - This is noticeable particularly for large vocabularies (McCallum and Nigam, 1998)

## Limitations and extension of CBR system

- CBR can't give good recommendation if the content does not contain enough information.
- Mainly to distinguish items the user likes from the items the user doesn't like.
- A better approach is to use collaborative and content-based features.
- The paper presented variety of learning algorithms for adapting user profiles, however the choice of algorithm depends upon the representation of content.

## Hybrid recommender systems

- Mix of recommender systems
- Recommender system classification – knowledge source
  - ▶ Collaborative (CF)
    - User's ratings "only"
  - ▶ Content-based recommender (CBR)
    - Product features, user's ratings
    - Classifications of user's likes/dislikes
  - ▶ Demographic
    - User's ratings, user's demographics
  - ▶ Knowledge-based (KB)
    - Domain knowledge, product features, user's need/query
    - Inferences about a use's needs and preferences

## Collaborative filtering (CF) vs. content-based recommenders (CBR)

	1	2	3	$\vdots$	$i$	$j$	$\vdots$	$n-1$	$n$
1					R	R			
2					-	R			
$\vdots$									
$u$					R	R			
$\vdots$									
$m-1$					R	R			
$m$					R	-			

- User-based CF: Searches for similar users in user-item "rating" matrix
- Item-based CF: searches for similar items in user-item "rating" matrix
- CN: Searches for similar items in item-feature matrix

## Recommender system problems

### □ Cold-start problem

- ▶ Learning based techniques
  - ▶ Collaborative, content-based, demographic
- ⇒ **Hybrid techniques**

### □ Stability vs. plasticity problem

- ▶ Difficulty to change established user's profile
- ⇒ **Temporal discount - older rating with less influence**

⇒ KB – fewer cold start problem (no need of historical data)

⇒ CF/Demographic – cross-genre niches, jump outside of the familiar (novelty, serendipity)

## Strategies for hybrid recommendation

- Combination of multiple recommendation techniques together for producing output
- Different techniques of different types
  - ▶ Most common implementations
  - ▶ Most promise to resolve cold-start problem
- Different techniques of the same type
  - ▶ Ex) NewsDude – naïve Bayes + kNN

## Seven type of recommender systems

- Weighted
- Switching
- Mixed
- Feature combination
- Feature augmentation
- Cascade
- Meta-level

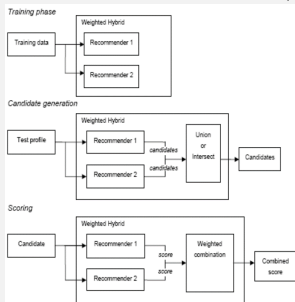

## Weighted hybrid

### □ Concept

- ▶ Each component of the hybrid scores a given item and the scores are combined using a linear formula
- ▶ When recommenders have consistent relative accuracy across the product space
- ▶ Uniform performance among recommenders (otherwise  $\Rightarrow$  other hybrids)

## Weighted hybrid (Cont)

- Training
- Joint rating
  - ▶ Intersection - candidates shared between the candidates
  - ▶ Union - case with no possible rating, then neutral score
- Linear combination

## Mixed hybrid

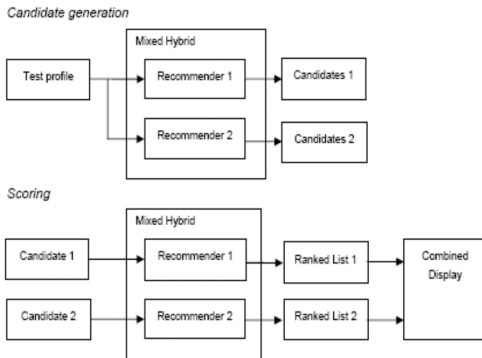

### □ Concept

- ▶ Presentation of different components side-by-side in a combined list
- ▶ If lists are to be combined, how are rankings to be integrated?
  - Merging based on predicted rating or on recommender confidence
- ▶ Not fit with retrospective data
  - Cannot use actual ratings to test if right items ranked highly

### □ Example

- ▶  $CF\_rank(3) + CN\_rank(2) \Rightarrow Mixed\_rank(5)$

## Mixed hybrid (cont)

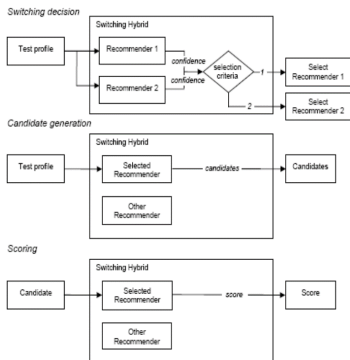

1. Candidate generation
2. Multiple ranked lists
3. Combined display

## Switching hybrid

### □ Concept

- ▶ Selects a single recommender among components based on recommendation situation
- ▶ Different **profile**  $\Rightarrow$  different **recommendation**
- ▶ Components with different **performance** for some types of **users**
- ▶ Existence of criterion for switching decision. Ex. Confidence value, external criteria

## Switching hybrid (cont)

1. Switching decision
2. Candidate generation
3. Scoring

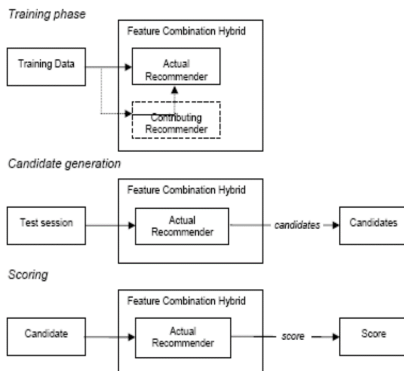

⇒ **No role for unchosen recommender**

## Feature combination hybrid

### □ Concept

- ▶ Inject features of one source into a different source for processing different data
- ▶ Features of “contributing recommender” are used as a part of the “actual recommender”
- ▶ **Adding new features** into the mix
- ▶ Not combining components, just combining knowledge source

## Feature combination hybrid (cont)

1. Feature combination
  - ▶ In training stage
2. Candidate generation
3. Scoring

## Feature augmentation hybrid

### □ Concepts

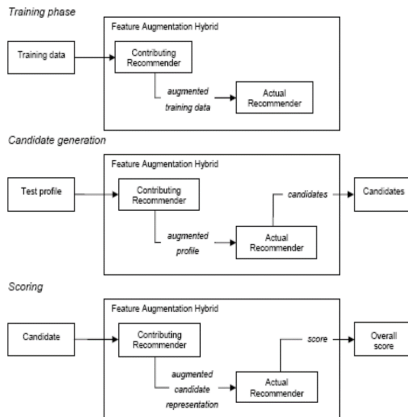

- ▶ Similar to Feature Combination
- ▶ Generates new features for each item by contributing domain
- ▶ Augmentation/combination – done offline

### □ Comparison with Feature Combination

- ▶ Not raw features (FC), but the result of computation from contribution (FA)
- ▶ More flexible to apply
- ▶ Adds smaller dimension

## Feature augmentation hybrid (cont)

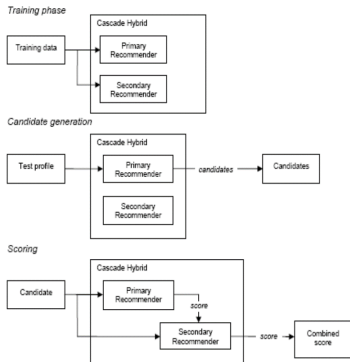

## Cascade hybrid

### □ Concepts

- ▶ **Tie breaker**
- ▶ Secondary recommender
  - Just tie breaker
  - Do refinements
- ▶ Primary recommender
  - Integer-valued scores – higher probability for ties
  - Real-valued scores – low probability for ties
  - Precision reduction

## Cascade hybrid (cont)

### □ Procedure

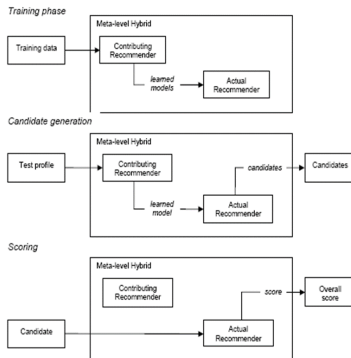

1. Primary recommender
2. Ranks
3. Break ties by secondary recommender

## Meta-level hybrid

### □ Concepts

- ▶ A model learned by contributing recommender  $\Rightarrow$  input for actual recommender
- ▶ Contributing recommender completely **replaces** the original knowledge source with a learned model
- ▶ Not all recommenders can produce the intermediary model

## Meta-level hybrid (cont)

### □ Procedure

1. Contributing recommender
2. Knowledge Source Replacement
3. Actual Recommender
